Sparse grids for Semi-Lagrangian schemes

<https://gitlab.com/stochastic-control/libstoc>

- Should be open for the end of this year,
- Most of what is presented below is included
  - 1 C++ library, multi OS
  - 2 MPI and threaded version
  - 3 Python binding for python users
  - 4 Extensive documentation.....

# Including the following resolution methods

Interpolation and function representation with grids in stochastic control

Xavier Warin

Interpolation and representation of a function with classical grids

Hierarchical representation of functions and linear sparse grids

Quadratic and cubic sparse grids

Examples

Sparse grids for regression methods

Sparse grids for Semi Lagrangian schemes

- 1 Regression methods (adaptive local grids, sparse grids, global polynomials)
- 2 Dynamic Programming with Longstaff Schwartz dealing with stocks (for storage etc...)
- 3 Semi Lagrangian methods for HJB equations (with linear interpolator, high order interpolators for full grids and sparse grids)
- 4 Stochastic Dual Dynamic Programming methods for multi stock optimization
- 5 Framework for optimization and simulation of the optimal control.

# Should be considered in future versions

Examples

Sparse grids for regression methods

Sparse grids for Semi Lagrangian schemes

The most common interpolation : given some regular meshes, interpolation linearly between the values on the mesh.

- Loved the theorist (permit to keep monotone schemes, stable etc...)
- easy to tensorize in dimension  $d$
- Slow convergence of the interpolator  $I_{1,\Delta x}$ : mesh  $\Delta x = (\Delta x^1, \dots, \Delta x^d)$ ,  $f \in C^{k+1}(\mathbf{R}^d)$  with  $k \leq 1$

$$\|f - I_{1,\Delta x} f\|_{\infty} \leq c \sum_{i=1}^d \Delta x_i^{k+1} \sup_{x \in [-1,1]^d} \left| \frac{\partial^{k+1} f}{\partial x_i^{k+1}} \right|$$

If  $f$  is only Lipschitz

$$\|f - I_{1,\Delta x} f\|_{\infty} \leq K \sup_i \Delta x_i$$

# Slow convergence while refining

**Figure:** Linear interpolator error for  $\sin(2\pi x)$

On a grid  $[-1, 1]$ ,  $N + 1$  points  $X = (x_0, \dots, x_N)$ , interpolate by the unique polynomial of degree  $N$  such that

$$I_N^X(f)(x_i) = f(x_i), 0 \leq i \leq N$$

Introduce the Lagrange polynomials  $l_i^X, 0 \leq i \leq N$  (satisfying  $l_i^X(x_j) = \delta_{i=j}$ )

$$I_N^X(f)(x) = \sum_{i=0}^N f(x_i) l_i^X(x)$$

Standard results with  $\lambda_N(X) = \max_{x \in [-1,1]} \sum_{i=0}^N |l_i^X(x)|$  the Lebesgue constant :

- 

$$\|I_N^X(f)(x)\|_\infty \leq \lambda_N(X) \|f\|_\infty \quad \text{Difficult to control } \|\cdot\|_\infty$$

- 

$$\|I_N^X(f)(x) - f\|_\infty \leq C \lambda_N(X) w(f, \frac{1}{N})$$

where  $w$  is the modulus of continuity

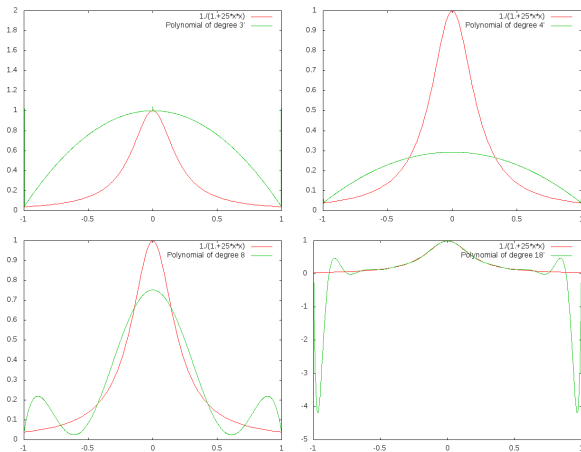

$$w(f, \delta) = \sup_{\substack{x_1, x_2 \in [-1, 1] \\ |x_1 - x_2| < \delta}} |f(x_1) - f(x_2)|$$

Try to find the grids with the best  $\lambda_N$ . Erdős theorem :

$$\lambda_N(X) > \frac{2}{\pi} \log(N+1) - C$$

# Runge effect : uniform grid $X_u$ is not optimal

$$\lambda_N(X_u) \simeq \frac{2^{N+1}}{eN \ln N}$$

The grids in  $[-1, 1]$  :  $\eta_1 = -1, \eta_{N+1} = 1$ , and  $\eta_i$   
( $i = 2, \dots, N$ ) zeros of  $L'_N$ . Legendre polynomials satisfies :

$$(N + 1)L_{N+1}(x) = (2N + 1)xL_N(x) - NL_{N-1}(x)$$

Lebesgue constant  $\lambda_N(X_{GLL}) \simeq \frac{2}{\pi} \ln(N + 1)$ .  
Interpolation formula on  $[-1, 1]$

$$I_N(f) = \sum_{k=0}^N \tilde{f}_k L_k(x),$$

$$\tilde{f}_k = \frac{1}{\gamma_k} \sum_{i=0}^N \rho_i f(\eta_i) L_k(\eta_i),$$

$$\gamma_k = \sum_{i=0}^N L_k(\eta_i)^2 \rho_i,$$

$$\text{and } \rho_i = \frac{2}{(M+1)ML_M^2(\eta_i)}, 1 \leq i \leq N + 1.$$

Sparse grids for regression methods

Sparse grids for Semi Lagrangian schemes

If  $f \in C^{k+1}([-1, 1]^d)$ ,  $k \leq N$

$$\|f - I_{N, \Delta x}^X f\|_{\infty} \leq c \frac{(1 + \lambda_N(X))^d}{N^k} \sum_{i=1}^d \Delta x_i^{k+1} \sup_{x \in [-1, 1]^d} \left| \frac{\partial^{k+1} f}{\partial x_i^{k+1}} \right|$$

- Of course, accuracy limited by the regularity of the solution.
- Is there a more effective way than tensorization to deal with functions in dimension  $d$  ?

- Hat function :  $\phi^{(L)}(x) = \max(1 - |x|, 0)$ ,
- By dilatation ( level  $l$  ) and translation ( given by  $i$  )  
 $\phi_{l,i}^{(L)}(x) = \phi^{(L)}(2^l x - i)$

- 

$$W_l^{(L)} := \text{span} \left\{ \phi_{l,i}^{(L)}(x) : 1 \leq i \leq 2^l - 1, i \text{ odd} \right\}$$

- Hierarchical space

$$V_n = \bigoplus_{l \leq n} W_l^{(L)}$$

- Nodal equivalent representation :

$$V_n = \text{span} \left\{ \phi_{n,i}^{(L)}(x) : 1 \leq i \leq 2^n - 1 \right\}$$

Quadratic and cubic sparse grids

Examples

Sparse grids for regression methods

Sparse grids for Semi Lagrangian schemes

**Figure:** Example of hierarchical coefficients

- Hierarchical values : estimation of the discrete second derivative of the function : adaptation possible by refining at node with highest hierarchical values,
- Same solution as linear interpolation in 1 D,
- But basis function supports intersect a lot : full matrix appearing in numerical methods.

- Basis functions :  $\phi_{\underline{l}, \underline{i}}^{(L)}(\underline{x}) = \prod_{j=1}^d \phi_{l_j, i_j}^{(L)}(x_j)$  for  $\underline{x} = (x_1, \dots, x_d)$ , a multi-level  $\underline{l} := (l_1, \dots, l_d)$  and a multi-index  $\underline{i} := (i_1, \dots, i_d)$ .

- with

$$B_{\underline{l}} := \left\{ \underline{i} : 1 \leq i_j \leq 2^{l_j} - 1, i_j \text{ odd}, 1 \leq j \leq d \right\}$$

$$W_{\underline{l}}^{(L)} := \text{span} \left\{ \phi_{\underline{l}, \underline{i}}^{(L)}(\underline{x}) : \underline{i} \in B_{\underline{l}} \right\}$$

- Sparse grid

$$V_n = \bigoplus_{|\underline{l}|_1 \leq n+d-1} W_{\underline{l}}^{(L)}$$

- Full grid  $V_n^F = \bigoplus_{|\underline{l}|_{\infty} \leq n} W_{\underline{l}}^{(L)}$

- Possible representation of  $V_n$  in term of nodal basis.

## 2 Full and Sparse basis

Representation of the  $W$  subspace for  $l \leq 3$  in dimension 2.

**Figure:** The two dimensional subspace  $W_l^{(L)}$  up to  $l = 3$ . Additional hierarchical functions corresponding to the full grid in dashed lines.

# Error associated to linear space grid

With roughly  $a_{n,d} = 2^n \frac{n^{d-1}}{(d-1)!}$  points, if  $\left\| \frac{\partial^{2d} u}{\partial x_1^2 \dots \partial x_d^2} \right\|_\infty < \infty$ ,  
[3, 5, 6]

$$\|f - I^1(f)\|_\infty = O(2^{-2n} \log(2^n)^{d-1}) \quad (1)$$

to compare to the full grid interpolator

$$\|f - I^1(f)\|_\infty = O(2^{-2n}) \quad (2)$$

with  $2^{dn}$  points.

The number of points increases slowly with the dimension with sparse grids with an error slowly above the full grid.

# Incorporation boundary points

- Either add boundary points
- either modify the basis functions near the boundary.

**Figure:** One dimensional  $W^{(L)}$  spaces with linear functions with "exact" boundary (left) and "modified" boundary (right) :  $W_1^{(L)}$ ,  $W_2^{(L)}$ ,  $W_3^{(L)}$ ,  $W_4^{(L)}$

Sparse grids for  
Semi Lagrangian  
schemes

- first method : explosion of the number of points with the dimension
  - in dimension 5, 2.8 millions points for 6401 inside the domain,
  - can't deal with some very high dimension problems
- second method : only effective if boundary points non important

Depending on the problem,

- stocks problems need accurate boundary treatment (dimension limited to 5) : first method needed
- PDE resolution in infinite domain, regression for conditional expectation will use the second method (dimension 7 to 10 )

How to upgrade the convergence properties of sparse grids  
without adding points...

On  $[2^{-l}(i-1), 2^{-l}(i+1)]$  by

$$\phi_{l,i}^{(Q)}(x) = \phi^{(Q)}(2^l x - i)$$

with  $\phi^{(Q)}(x) = 1 - x^2$ .

$$I^{(Q)}(f)(x) = \sum_{l \leq n, 1 \leq i \leq 2^l - 1, i \text{ odd}} \alpha_{l,i}^{(Q)} \phi_{l,i}^{(Q)}(x)$$

# quadratic (cont)

where for  $m = x_{l,i}$

$$\begin{aligned}
 \alpha(m)^{(Q)} &= f(m) - \left( \frac{3}{8}f(w(m)) + \frac{3}{4}f(e(m)) - \frac{1}{8}f(ee(m)) \right) \\
 &= \alpha(m)^{(L)}(m) - \frac{1}{4}\alpha(m)^{(L)}(e(m)) \\
 &= \alpha(m)^{(L)}(m) - \frac{1}{4}\alpha(m)^{(L)}(df(m))
 \end{aligned}$$

where  $df(m)$  is the direct father of the node  $m$  in the tree.

Two strategies:

- Local adaptation :
  - Refine nodes with highest surplus adding sons (left and right) in all directions ,
  - Derefine (if use in temporal problem) if surplus calculated to small,
  - Not sure to refine/derefine at the good points,
  - Necessity to be sure that all added nodes have fathers in all directions (if not, add points)
- Dimension adaptation: select a multilevel according to an error estimation and refine all the points at this level in all directions.

The adaptation to choose should depend on the problem....

Sparse grids for  
Semi-Lagrangian  
schemes

- Till dimension 6, provide good results for american style basket options,
- No reference in dimension above 6,
- Comparing to [7], less particles seem to be necessary. Not sure sparse grids for regressions are competitive (till dimension 6),
- Cost of the method is in the matrix construction (nearly a full one).

$$\begin{aligned} \frac{\partial v}{\partial t}(t, x) - \inf_{a \in A} \left( \frac{1}{2} \text{tr}(\sigma_a(t, x) \sigma_a(t, x)^T D^2 v(t, x)) + b_a(t, x) Dv(t, x) \right. \\ \left. + c_a(t, x) v(t, x) + f_a(t, x) \right) = 0 \text{ in } Q \\ v(0, x) = g(x) \text{ in } \mathbf{R}^d \end{aligned} \quad (3)$$

where

- $Q := (0, T] \times \mathbf{R}^d$ ,  $A$  a complete metric space,
- $\sigma_a(t, x)$  is a  $d \times q$  matrix,
- $b_a$  and  $f_a$  coefficients functions defined on  $Q$  in  $\mathbf{R}^d$  and  $R$ .

HJB associated to a controlled process  $X_s^{t,x}$  with  $W_s$  a  $q$  dimensional Brownian motion:

$$dX_s^{t,x} = b_a(s, X_s^{t,x}) dt + \sigma_a(t, X_s^{t,x}) dW_s \quad (4)$$

Sparse grids for Semi Lagrangian schemes

Using development of  $\phi$

$$\phi(x + b_a h + \sigma_a \sqrt{h}) = \phi(x) + h b_a D\phi(x) + \sqrt{h} \sigma_a D\phi + \frac{\sigma_a^2 h}{2} D^2 \phi + \frac{\sigma_a^2 h^{3/2}}{6} D^3 \phi + O(h^2)$$

$$\phi(x + b_a h - \sigma_a \sqrt{h}) = \phi(x) + h b_a D\phi(x) - \sqrt{h} \sigma_a D\phi + \frac{\sigma_a^2 h}{2} D^2 \phi - \frac{\sigma_a^2 h^{3/2}}{6} D^3 \phi + O(h^2)$$

So

$$(\phi(x + b_a h + \sigma_a \sqrt{h}) + \phi(x + b_a h - \sigma_a \sqrt{h}) - 2\phi(x)) \simeq 2h b_a D\phi(x) + h \sigma_a^2 D^2 \phi + O(h^2)$$

And use explicit scheme

$$v(t + h, x) = v(t, x) + \inf_{a \in A} \frac{1}{2} [(v(t, \phi_{a,h}^+(t, x)) + v(t, \phi_{a,h}^-(t, x)) - 2v(t, x)) + h c_a(t, x) v(t, x) + h f_a(t, x)]$$

$$\phi_{a,h}^+(t, x) = x + b_a(t, x)h + \sigma_a(t, x)\sqrt{h}$$

$$\phi_{a,h}^-(t, x) = x + b_a(t, x)h - \sigma_a(t, x)\sqrt{h}$$

Sparse grids for  
regression  
methods

Sparse grids for  
Semi Lagrangian  
schemes

- $v(t, \cdot)$  represented on a grid, for  $v(t, \phi_{a,h}^{\pm}(t, x))$  interpolation on a grid is required,
- Regular full grids with high order interpolators are possible [8]
- Results with sparse grids [9]

- $\{S_t, t \in [0, T]\}$  be an Ito process modeling the price evolution of  $n$  financial securities,
- $\{\theta_t, t \in [0, T]\}$  the investor strategy,
- Portfolio value

$$dX_t^\theta = \theta_t \cdot \frac{dS_t}{S_t} + (X_t^\theta - \theta_t \cdot \mathbb{1}) \frac{dS_t^0}{S_t^0} = \theta_t \cdot \frac{dS_t}{S_t} + (X_t^\theta - \theta_t \cdot \mathbb{1}) r_t dt,$$

- Maximize the portfolio value :

$$v_0 := \sup_{\theta \in \mathcal{A}} \mathbb{E} \left[ -\exp \left( -\eta X_T^\theta \right) \right].$$

# The two dimensional case ( $r = 0$ )

Asset dynamic (Heston model)

$$\begin{aligned} dS_t &= \mu S_t dt + \sqrt{Y_t} S_t dW_t^{(1)} \\ dY_t &= k(m - Y_t)dt + c\sqrt{Y_t} \left( \rho dW_t^{(1)} + \sqrt{1 - \rho^2} dW_t^{(2)} \right), \end{aligned}$$

HJB equation :

$$\begin{aligned} v(T, x, y) &= -e^{-\eta x} \\ 0 &= -v_t - k(m - y)v_y - \frac{1}{2}c^2 y v_{yy} - \\ &\quad \sup_{\theta \in \mathbb{R}} \left( \frac{1}{2}\theta^2 y v_{xx} + \theta(\mu v_x + \rho c y v_{xy}) \right) \end{aligned}$$

Quasi explicit solution (Zariphopoulou)

$$v(t, x, y) = -e^{-\eta x} \left\| \exp \left( -\frac{1}{2} \int_t^T \frac{\mu^2}{\tilde{Y}_s} ds \right) \right\|_{\mathbb{L}^{1-\rho^2}}$$

where the process  $\tilde{Y}$  is defined by

$$\tilde{Y}_t = y \quad \text{and} \quad d\tilde{Y}_t = (k(m - \tilde{Y}_t) - \mu c \rho)dt + c\sqrt{\tilde{Y}_t}dW_t.$$
